

PRD — Event Supplier Marketplace Platform

1. Product Overview

The platform is a web-based marketplace designed to connect users planning events with relevant suppliers.

This is not an event management system.

The system does not manage the execution of the event itself, but helps users discover suppliers, receive ideas, access supplier contact details, and use AI assistance for planning and supplier recommendations.

The platform operates with three main sides:

1. User Side
2. Supplier Side
3. Admin Side

The business model is primarily based on suppliers, where suppliers are the paying customers of the platform and users access the platform mostly for free.

The platform must be fully responsive for mobile devices, although it is web-first.

This logic was confirmed during the project meeting and transcript .

2. User Roles

2.1 User

A User is anyone looking to organize an event.

Examples:

- Couple planning a wedding
- HR manager planning a company event
- Welfare manager
- Private person planning a birthday
- Event producer
- Anyone searching for suppliers

The user does not manage the event inside the platform.

The platform helps the user:

- Find suppliers
- Get ideas
- Access supplier contact details
- Receive AI recommendations
- Publish job offers for suppliers

Users can browse freely without mandatory registration in most cases.

Account creation is only required in two situations:

1. After more than 10 AI chat messages
2. When publishing a job offer

This was explicitly defined in the meeting .

2.2 Supplier

A Supplier is the business-side customer of the platform.

Examples:

- DJ
- Catering
- Photographer
- Event Hall
- Lighting
- Sound Systems
- Decorations
- Attractions
- Business Event Vendors

Suppliers:

- Create and manage their profile
- Receive leads
- Apply to job offers
- Become discoverable in marketplace search
- Receive exposure through AI recommendations

Suppliers are the monetized users of the system.

2.3 Admin

The Admin controls the full platform.

Admin permissions include:

- View all users
- View suppliers
- View incomplete registrations
- View unpaid users
- View job posts
- Manage supplier approvals
- Monitor AI usage
- View system analytics
- Control featured suppliers
- Manage categories/subcategories
- Review reports and abuse cases

Admin must be able to see users even if they did not complete payment or registration, as requested by client.

3. Core Modules

3.1 Supplier Marketplace

Main searchable supplier directory.

Users can:

- Search suppliers
- Filter suppliers
- Open supplier profiles
- Access contact details
- Save favorites
- Share suppliers
- Contact externally (phone / WhatsApp / email)

Important:

The platform does NOT handle the final transaction.

The goal is to connect both sides, not to mediate payment.

This was clearly stated in the meeting:

“No commission on the event itself, only connection between both sides” .

3.2 AI Event Planning Agent

AI-based assistant for helping users plan events.

The AI should function like a smart event planning assistant.

It helps users:

- Understand what suppliers they need
- Get recommendations
- Build event ideas
- Receive supplier suggestions from internal database
- Get event concepts
- Receive job board recommendations
- Navigate to supplier categories

Example:

User writes:

“I’m planning a wedding and need a DJ”

AI responds with:

- clarifying questions
- recommended suppliers
- relevant supplier categories
- budget suggestions
- event ideas
- direct links to suppliers

The AI must recommend suppliers from the platform database, not generic internet results.

This was explicitly requested by the client .

3.3 Job Board

Users can publish supplier requests as “job offers”.

Example:

“I need DJ + sound system for a company event for 1,200 people in Tel Aviv”

The job post includes:

- Event type
- Date
- Budget

- Quantity / audience size
- Supplier category needed
- Description
- Location

Suppliers can apply to the job.

When supplier applies:

- supplier details are sent to the user
- user receives notification
- system stores candidate history

Notifications should support:

- Email
- SMS

This was confirmed in meeting .

4. Main User Flows

4.1 User Flow — Supplier Search

Flow

Landing Page

→ Search Supplier

→ Live Search Suggestions

→ Supplier Listing

→ Apply Filters

→ Open Supplier Profile

→ View Contact Details

→ Save / Share / Contact

Notes

Search must be live search.

No “Search Button” is required.

As user types:

- supplier names

- categories
- tags

results appear dynamically.

This was specifically requested during meeting.

4.2 User Flow — AI Planning

Flow

Landing Page

→ AI Planning

→ Select Event Type

→ AI Conversation Starts

→ AI asks clarifying questions

→ AI recommends suppliers

→ AI suggests categories

→ AI may redirect to Job Board

Registration Trigger

First 10 AI messages = free

After 10 messages:

Require account creation

This is a hard business rule.

4.3 User Flow — Publish Job Offer

Flow

Landing Page

→ Job Board

→ Publish Job Offer

→ Registration Required

→ Create Account

→ Fill Job Form

→ Publish

→ Suppliers Apply

→ User Receives Notifications

Registration is mandatory here.

4.4 Supplier Flow

Flow

Landing Page

- Join as Supplier
- Registration
- Supplier Profile Setup
- Category Selection
- Service Areas
- Contact Details
- Gallery Upload
- Social Links
- Pricing Information (optional)
- Verification / Approval
- Published in Marketplace

4.5 Supplier Applying to Job

Flow

Supplier Dashboard

- Job Board
- Open Job Offer
- Apply
- Supplier Details Sent
- User Notification Triggered

5. Supplier Profile Structure

Each supplier profile should include:

- Business name
- Category
- Subcategory
- Description
- Service areas
- Contact phone
- WhatsApp
- Email

- Website
- Instagram
- Facebook
- Gallery
- Reviews
- Rating
- Working days
- Certifications
- Insurance
- Accessibility
- Kosher options (if relevant)
- Languages spoken
- Government supplier flags (if relevant)

Figma confirms extensive supplier profile structure.

6. Categories & Filtering Logic

The system uses:

Event Type

Examples:

- Wedding
- Corporate Event
- Birthday
- Bar Mitzvah
- Bat Mitzvah
- Brit
- Luxury & Leisure
- Bachelor / Bachelorette
- Hafrashat Challah

Then:

Event Subtype

Example:

Corporate Event → Conference

Then:

Supplier Categories

Examples:

- Food
- Music
- Photography
- Venues
- Attractions
- Logistics
- Branding
- Production

Then:

Specific Filters

Examples:

- Kosher Mehadrin
- Open on Shabbat
- Free Parking
- Accessible
- Outdoor Event
- Speaks English
- Region
- Minimum Rating

This structure is shown in Figma screens.

7. Authentication Logic

Registration is NOT mandatory for general browsing.

Registration required only for:

Users

- More than 10 AI messages
- Publishing job offer

Suppliers

- Always required

This is critical business logic and should not be changed.

8. Notifications

System notifications include:

User Notifications

- Supplier applied to job
- AI registration reminder
- Saved suppliers follow-up

Supplier Notifications

- New relevant job posted
- Lead received
- Profile approval
- Account reminders

Channels:

- Email
- SMS

Potential future:

- WhatsApp notifications

9. Admin Dashboard

Admin should have:

User Management

- all users
- incomplete users
- unpaid users

Supplier Management

- approval flow
- featured suppliers
- verification

Job Board Management

- all job offers
- applications
- abuse reports

AI Monitoring

- conversations
- usage analytics
- failed recommendations

CMS

- categories
- filters
- homepage content
- banners

10. Technical Notes

Recommended stack:

Frontend:

- Next.js

Backend:

- Node.js / NestJS

Database:

- PostgreSQL / Supabase

AI Layer:

- OpenAI Assistant / Agent Architecture

Notifications:

- Email + SMS Provider

Hosting:

- AWS

Search:

- Fast searchable supplier index

Important:

System must be optimized for mobile responsiveness.

Web first, mobile-perfect.

13. Advanced Filtering Logic

The supplier filtering system must be dynamic and divided into 3 main layers.

13.1 First Layer — Subcategories of the Selected Category

The first filters shown must be the subcategories of the selected supplier category.

Example:

If the user selects the category:

Food

The subcategories displayed should include:

- Catering
- Chef Meals
- Food Stations
- Serving Trays
- Alcohol Bar
- Desserts
- Sweet Bar
- Private Chef

Important:

The displayed subcategories also depend on the event type selected earlier.

Example:

If the user selected:

Wedding

The system should pre-select and prioritize only the subcategories defined in the mapping table as relevant for weddings.

For example:

- Dairy Catering
- Alcohol Bar
- Serving Trays

And should not display irrelevant subcategories for that event type.

The system must work according to a clear mapping table between:

Event Type → Category → Subcategory

As defined in the Figma and project meeting.

13.2 Second Layer — Category-Specific Filters

Each supplier category must have its own unique filters.

Examples:

Food

- Kosher
- Mehadrin Kosher
- Dairy / Meat / Parve
- Vegan
- Gluten-Free

DJ / Music

- Music Style
- Sound Equipment
- Live Performance
- Corporate Event Experience

Photography

- Stills
- Video
- Drone

- Magnets

Event Venue

- Outdoor Event
- Accessibility
- Free Parking
- Guest Capacity

These filters must be relevant only to their specific category.

13.3 Third Layer — General Filters

General filters that apply to all suppliers:

- Location in Israel
- Service Area
- Minimum Rating
- Ministry of Defense Supplier
- Reservist
- Insurance
- Open / Working on Shabbat
- Speaks Additional Languages
- Accessibility
- Verified Supplier

These filters must always be available across all categories.

14. Automatic Supplier Draft Saving During Registration

If a supplier starts the registration process but does not complete it, the system must automatically save all entered data.

Purpose of this feature:

Allow the supplier to return later and continue registration without losing information.

Examples:

- Supplier entered business name and left
- Supplier uploaded gallery but did not finish
- Supplier stopped before payment
- Supplier stopped before final approval

The admin must be able to view these incomplete supplier registrations.

Additionally:

The system should support:

- Automatic reminder emails
- Automatic SMS reminders
- Admin tracking for incomplete registrations

This also connects to the admin requirement of viewing incomplete users.

15. “Refer a Friend” System for Suppliers

The platform must include a referral system for registered suppliers.

Logic:

If a registered supplier sends their unique registration link to a new supplier, and the new supplier registers through that link and completes registration —

the referring supplier receives a benefit on subscription renewal.

Examples of rewards:

- Subscription renewal discount
- One free extra month
- Higher marketplace exposure
- Internal platform credit

The exact reward will be defined later.

System requirements:

- Unique referral link generation for each supplier
- New supplier attribution to referring supplier
- Registration status tracking
- Completion verification
- Automatic reward eligibility calculation
- Supplier dashboard for referral tracking
- Admin dashboard for referral management and control

16. System Automations

The platform must be built with a clear infrastructure for Email / SMS automations.

Even if not all automations are fully defined yet, this must be included in the PRD.

Possible automations include:

16.1 User Automations

- Supplier applied to a job post
- Registration completion reminder
- Reminder to continue AI conversation
- Follow-up after viewing a supplier
- Reminder to publish a new job offer

16.2 Supplier Automations

- New lead received
- New relevant job opportunity
- Profile completion reminder
- Subscription renewal reminder
- Profile approval / rejection
- Inactivity reminder

16.3 Admin Automations

- Suppliers with incomplete registration
- Inactive suppliers
- System issue alerts
- Lead monitoring
- Unusual AI usage monitoring

16.4 Technical Requirements

Automations must support:

- Email
- SMS
- Future support for WhatsApp
